

Entity Tagging

Entity tagging is the key to efficiently organizing information and gaining valuable insights from it. Entity tagging allows you to categorize and manage entities in your control items through tags, without being limited to rigid hierarchies or predefined categories. You create your own taxonomy and organize it according to your individual needs, resulting in increased clarity and clear separation of information.

Description

Entity tagging is the key to efficiently organizing information and gaining valuable insights from it.

Entity tagging allows you to categorize and manage entities in your control items through tags, without being limited to rigid hierarchies or predefined categories. You create your own taxonomy and organize it according to your individual needs, resulting in increased clarity and clear separation of information. Tags can be created by each user or selected from a self-defined set of keywords, as desired.

Using entity tagging is straightforward. You create a clear taxonomy group, place the control at the desired entity and assign the tags there. Thanks to an intelligent autocomplete system, known tags are suggested to you. Duplicate and erroneous tags can be adjusted and merged. Aliases can be defined to avoid duplicates and to assign them correctly automatically. The advantages of entity tagging lie primarily in the analysis and evaluation of the resulting data, which enables a clear cluster analysis, the rapid identification of anomalies and the discovery of behavioral patterns. This makes entity tagging an indispensable tool for Big Data analysis.

With Entity Tagging, you get a comprehensive data management solution that enables hierarchy-free categorization. Administrators benefit from the ability to analyze data based on tags and identify behavioral patterns. Entity tagging dramatically increases the efficiency and accuracy of your data analysis.

Give your data management and analysis the control it deserves. Use entity tagging to discover how to best organize your data and gain the insights that will drive your business forward.

The advantages at a glance

- Data is captured according to its own categorization and can be easily displayed and analyzed
- Anomalies can be identified quickly
- Ideal prerequisite for Big Data or AI-supported analyses

Features

- Creation of clear taxonomy groups.
- Entity tagging can be applied anywhere on any entity.
- Intelligent autocomplete system for tag suggestions.
- Merging of duplicate or erroneous tags.
- Definition of aliases to automatically correct duplicates.
- Categorization and analysis of data.
- Display of data as a tag cloud.
